

# 10. Finishing installation

Video link

1. Start the engine.
2. The engine should be running normally. However, the first start-up after the installation may be a bit longer if the ethanol sensor is installed in the pressure line and fuel line is drained empty.
3. When you have started the engine, observe the installed fuel line connectors and fuel hose. Even a small leak could cause a fire hazard.
4. If vehicle won't start, check the ground wire connection.
5. If vehicle idles badly, check the polarity of wiring harness connectors and that connectors are connected properly.
6. You can monitor control unit with mobile application.
7. Installation is ready and you can now refuel gasoline, E85 or any mixture of these in your vehicle.
